

Corey Center

The Corey Center is based in Atlanta, Georgia, where I-75 intersects I-20, an area dubbed the Crossroads of the South. Built in 1975, the building features a landmark smokestack and consists of 10,000 square feet of office space and 25,000 square feet of warehouse space.

Eight Tune® devices were installed, one for each of the building's eight breaker boxes. Noesis, a trusted third-party consultant, analyzed the installation. Noesis monitored the facility for the first calendar year and again in each of the subsequent three years. Across the four years of analysis, **Tune® delivered an average 14.8% kWh reduction for the Corey Center.***
